Paid fresh physical checks

For AI agents that manage equipment at another site

One question. One paid observation. One signed answer with an expiry.

FieldProof

Remote-equipment AI builder: initial buyer hypothesis

The current physical question

Is this enclosure contact closed now?

The ESP32-C6 samples the BOOT contact stand-in after payment. Its P-256 key signs the question and result.

Illustrated use case. The prototype observes a button contact. It moves no robot or gate.

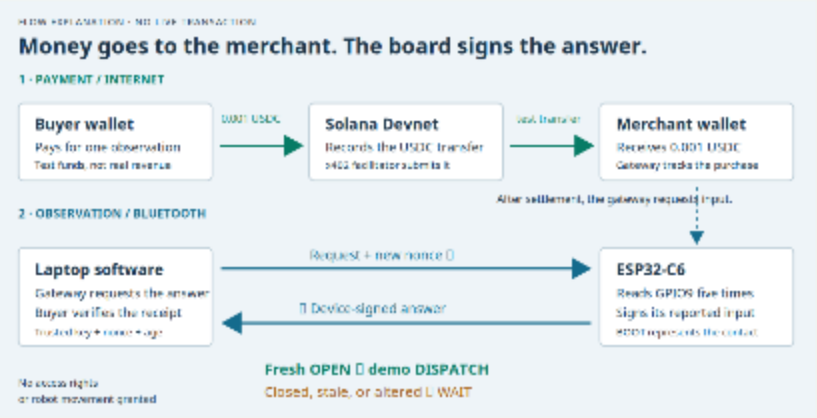

A contact state does not prove contents, safe operation, or access permission.

One paid observation

Buyer sets provider, question, price, and age limit.

x402 settles 0.001 Devnet USDC on Solana Devnet before capture.

ESP32 samples the contact and returns its original P-256 signed receipt.

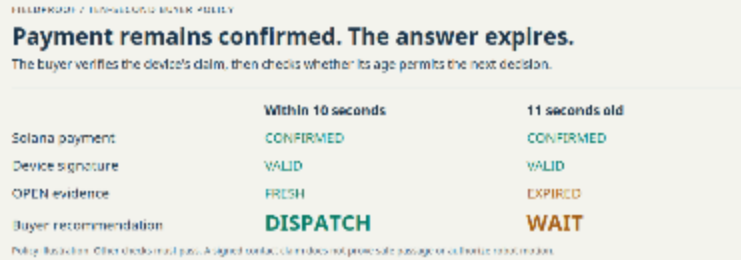

peaq identity and linked activity event: INTEGRATION PENDING

The buyer accepts fresh evidence

Check the selected key, challenge, samples, and signature.

Then check age against the buyer's ten-second policy.

The same valid answer becomes WAIT after expiry. A changed answer fails signature verification.

The first buyer test

One AI builder and one authorized equipment operator.

Compare this check with the current API or manual process. Measure useful answers, integration work, failures, and recovery.

Repeat at a second site to test reuse. Paid integration and support remain business hypotheses.

No validated customer or commercial revenue yet.
